

COMP2003 Client Meeting 4

04.03.25

Attendance

- All members within Group 3 attended
 - From Global 4, Barbara Cifer (International Compliance Officer), Robbie Down (SecOps member) and Kieran Walker (SecOps member) joined the meeting
 - Manager Jonathan White was supposed to attend however was caught up in a previous meeting
-

Meeting Discussion Points

Live Demonstration

- Liam ran the software and gave a live demo of our MVP to Global 4 (showing the UI, not FastAPI)
 - He explained all the current features we have and how they work in the backend
 - Liam explained the next planned features we have— the Specialisations (part of ProfileService), the profiles and accounts, as well as Closed Tickets Archive.
 - We held a Q&A after the demo, where SecOps were happy with the current product.
-

AI Hosting concerns and plans

- They asked questions regarding AI hosting plans and its security
- Toby explained the current technical process of the AI categorisation (SpaCy)
- Liam explained to them our plans with AI hosting:

- Will need servers that are designed for AI processes, such as GPU servers
 - It is dependant on Global 4's budget for these servers.
 - Kieran told us that currently Global 4 doesn't have any such servers.
-

Presentation of integration plans

- Khyati presented the Integration plan diagram and explained it through the integration:
 - Usage of Microsoft Entra ID
 - Explanation of splitting the software into 3 microservices (AIService, TicketService, ProfileService)
 - Uses of database and what the microservices are handling
- Global 4 had no questions regarding the integration
- Kieran and Robbie made us aware of SAML in place of Entra as it is easier to use

Other issues with tickets

- Also made us aware of an issue they are facing— the size of tickets have more impact on performance and loading than the volume of tickets:
 - E.g. 1 ticket size > 10 tickets size
 - This is because of the large chain of emails attached to the ticket
 - Robbie said they would like it if we could truncate this, as AutoTask doesn't handle data very well (Kieran)
 - Liam proposed implementing pipelining and vectorising:
 - take tickets and pass them to separate cores (quad-core processing)
-

Important Placement Opportunity

- We proposed the important opportunity of Khyati and Toby being internals to Global 4 via a 1-year placement, which will allow us to gain experience and complete integration:

- Benefits of this are:
 - Since we will be internals, we won't need to worry about external data leaks
 - We were able to produce this MVP whilst juggling 2 modules alongside— we can implement more features, focusing on quality, robustness and security if all our time is allocated
 - Khyati and Toby can gain industry experience with Global 4
 - They were on board with the idea however Jonathan and Peter are better suited to be discussing the placement opportunity with, so Global 4 suggested we ping an email to them
-

DPIA Form Discussion

- As externals, we will need to sign DPIA if we would like to implement integration
 - As internals of Global 4, we wouldn't need to sign a DPIA form, but would need to sign a general GDPR form
-

Next Steps

- Robbie said we should continue to bogus data to make sure it is fully tested, complete and secure, before considering job roles
 - improve speed of loading
 - test with example user using the software
