

COMP2003 Client Meeting 3 — Minutes

Presentation Overview

- **Automatic Ticket Organisation:**
 - Raised to SecOps.
 - AI organiser will separate tickets and align them to categories such as type of issue, priority, and company.
 - UI will display this categorised data, automating a previously manual process. — *Liam*
- **Stage 1 – Ticket Creation:**
 - Use a relational database to identify ticket attributes.
 - These attributes will be passed to the AI for processing. — *Liam*
- **Stage 2 – LSA Agreements:**
 - AI will read and analyse tickets while considering LSA agreements from the company.
 - It will then sort tickets accordingly. — *Toby*
- **Stage 3 – Dashboard UI:**
- Explanation of how the dashboard will present organised ticket data. — *Khyati*

Project Background & Justification

- Global4 struggles with automation of issues and ticket management.
- This solution is designed to address that challenge.
- Liam reiterated Stage 1 and clarified that this is a group project module for academic purposes.

- Tickets are received through various mediums — emails, phone numbers, and direct ticket submissions.
 - Reporting visibility is important for Global4's customers.
-

Integration Challenges & Considerations

- Communication between two software systems is problematic — a ticket may be closed in one system but remain open in another.
 - Global4 suggested working with AutoTask:
 - Managing a front end to handle ticket alerts more cleanly.
 - Major issue: redundant alerts.
 - Proposed solution: build a front end that filters and presents data effectively.
 - Data acquisition:
 - Liam confirmed we are reviewing their database schema to avoid breaching Global4's data security.
 - Data will be sourced from the root of emails and either passed into new software or forwarded to AutoTask.
 - Preferred approach:
 - Keep AutoTask tickets open.
 - Use external software to manage and categorise tickets via AI.
 - AI training:
 - Feed dummy data that mimics real ticket formats.
 - AI will learn attributes and categorisation logic.
 - Ideally hosted on a remote server on Global4's side to continuously receive and output data. — *Toby*
-

AutoTask Integration

- AutoTask pulls in email alerts from the mailbox.

- Potential to hook into the mailbox, analyse alerts, and modify them before sending to SecOps.
 - Global4 expressed concern about compatibility between AutoTask and our solution.
 - Integration of AutoTask API is essential.
 - For the solution to be valuable:
 - AutoTask must remain in place.
 - We should not rewrite AutoTask's functionality.
 - Instead, improve the UI and presentation of AutoTask data.
 - The system should highlight redundant tasks. — *Global4*
-

Communication & Next Steps

- Liam re-emphasised the use of Teams Channels for ongoing communication and updates.
- Khyati requested a list of requirements from Global4:
 - What they expect the solution to do, i.e. backend requirements, front end specifications.
 - What they need from us.
- This will help us create a backlog and delegate tasks effectively.
